UMHackathon 2026 · AI Systems & Agentic Workflow Automation

FutureJob

An Agentic AI Engine that kills the resume black hole — for good.

"Finding a job shouldn't be a black hole."

THE PROBLEM

Problem Statement

The Messy Reality

Currently, hiring is a fragmented mess of PDFs, endless emails, and manual "keyword hunting" that drains the life out of both students and HR teams

The Silence of the "Black Hole"

Most students apply and hear nothing back because managing the transition from "Applied" to "Interview" or "Rejected" requires too many manual decisions across too many tools.

The Language Barrier

Old systems are "dumb"—they'll reject a brilliant developer because their resume says "Next.js" instead of "React," failing to understand the context and losing great talent in the process.

75% of resumes never reach a human recruiter — filtered by ATS alone.

Solution

Agentic Workflow Orchestration via AI

Central Reasoning Engine

FutureJob utilizes the AI as the core orchestrator to transform messy career data into intelligent, automated processes

Stateful & Adaptive Engine

The system operates as a stateful engine that manages the entire lifecycle of an applicant, handling incomplete data and ambiguous job descriptions.

Indispensable Intelligence

Without the Z.AI component, the system loses its ability to coordinate the complex logic of matching, reasoning, and "Skill Quest" generation.

Hipp0Senpai

System Workflow (Students/Applicants)

1. Ingestion: Instead of filling out complex forms, the student provides raw, unstructured text (a messy bio, an old resume, or a LinkedIn summary).
2. Structuring: The Gemini GLM parses this input into a highly structured JSON profile, identifying hidden skills, seniority levels, and technical stacks.
3. Discovery & Matching: The system calculates a Bidirectional Match Score against open jobs. Students see not just a list, but a ranked feed with "Reasoning Trace" (e.g., "Matched 92% because your React experience aligns with their Fintech project").
4. The Feedback Loop:
    a. If Approved: The system unlocks a direct chat proxy and interview scheduling interface.
    b. If Rejected: The system doesn't just say "No." It generates a "Skill Quest"—an actionable roadmap of specific skills or projects the student needs to complete to qualify for that role in the future.

Hipp0Senpai

System Workflow (Company)

1. Onboarding: Companies register and submit operational details. They enter a "Pending" state until an Admin verifies their legitimacy.
2. Job Creation (Natural Language): The recruiter types a simple description (e.g., "I need a senior dev for a crypto project who knows Rust"). The GLM structures this into a formal job post with specific requirements and expectations.
3. Screening: Companies use a high-density, industrial-style dashboard. Candidates are pre-sorted by match score. The recruiter sees the AI's reasoning for each candidate's ranking immediately.
4. Action & Orchestration: The recruiter performs one-click actions: Shortlist, Interview, or Reject. The system handles all automated notifications.
5. Engagement: Once a candidate is shortlisted, a secure chat proxy opens to finalize interview details without exposing personal contact info prematurely.

Hipp0Senpai

Key Feature

Students (Applicants)

- AI Profile Builder
- Match Scoring Engine
- Automated Career Routing
- Skill Quest Engine
- Interview Command Center

Company

- Natural Language Job Posting
- High-Density Candidate Grid
- AI Screening Trace
- Unified Messaging & Interviewer
- Company Profile Management

Admin

- Company Verification
- Admin dashboard

DEMO
